

Azure Data Factory – Data Flow Activity

Source → Derived Column → Select → Sink

① Create Data Flow & Add Source

New data flow → Source type = Dataset → Azure Blob Storage

New data flow created → dataflow1

New dataset → Azure Blob Storage selected

Set properties → DS_1 linked to weather_data.csv

② Import Schema & Enable Debug

source1 connected to DS_1 → Data flow debug turned on

source1 imports schema → 5 columns total

Data flow debug → getting the cluster ready

	date	city	temperature_c	humidity_pct	condition
+	2026-08-19	New York	22.5	60	Sunny
+	2026-08-20	London	18.3	75	Cloudy
+	2026-08-21	Tokyo	25.1	68	Rainy
+	2026-08-22	Sydney	19.8	55	Clear
+	2026-08-23	Mumbai	30.2	80	Humid

Properties

General Related

Name * dataflow1

Description

Cancel

Data preview → 5 rows of weather data

③ Add Derived Column Transformation

Schema modifier → Derived Column added after source1

Schema modifier menu → Derived Column selected

Projection → source columns: date, city, temperature_c, humidity_pct, condition

derivedColumn1 added → 6 total columns

④ Build the Expression

New column temp_F = (temperature_c * 1.8) + 32

New column name entered → temp_F

Open expression builder

*Expression builder → $(temperature_c * 1.8) + 32$*

⑤ Derived Column Result

Expression saved → temp_F visible in data preview

Expression saved → derivedColumn1 settings

Data preview → temp_F column added

⑥ Add Select Transformation

Schema modifier → Select added → city column removed

Schema modifier menu → Select added

Select settings → city column unchecked / deleted

2025-08-23	30	80	Humid	86.0

Cancel

Data preview → city dropped, temp_F retained

⑦ Add Sink & Configure Output

Destination → Sink added → DS_2 (output container)

Destination menu → Sink added

Sink settings → Dataset DS_2 → Test connection successful

⑧ Run the Pipeline

pipeline1 → Data flow activity → Debug run

pipeline1 created → Data flow activity added

Pipeline debug run → dataflow1 succeeded

⑨ Verify Output in Blob Storage

output container → CSV file with temp_F column

Output container → SUCCESS file + part-00000 csv

CSV content → final data with temp_F column

Logic:

Source (weather_data.csv) → Derived Column (temp_F) → Select (drop city) → Sink (DS_2 / output container)
